

TermSecure adds an additional layer of security to your Windows environment, providing you with the protection you need.

TermSecure™ for ACP ThinManager Ready clients adds tremendous functionality to the plant floor. This unparalleled security is only available with ThinManager® clients and actually boosts productivity and flexibility. Read on and you'll see that it's just plain smart.

Protect...

TermSecure adds an additional layer of security to your Windows environment providing you with the protection you need.

...and Serve

Authorized users still need quick access to their applications. As you move from client to client, TermSecure logs you in and instantly reconnects you to your existing Terminal Server sessions. Your programs follow you and appear on screen served up and ready to use as you approach. Very cool. Walk away and your applications disappear.

Authenticate

Identify yourself at a TermSecure enabled device using an RFID proximity card (short or long range), a USB flash key, or login manually. Combine authentication methods and greatly increase security.

Control

Control user access to applications through group permissions; or to terminals using both group permissions and terminal scheduling. Limit a specific user to a weekly, daily or hourly schedule or disable the terminal itself at any time you choose.

Extend

Drop our TermMon ActiveX control into your applications and you can program in terminal and user specific functionality including session switching, tiling, TermSecure functions, event logging, and terminal status and management.

Save

Prevent a single unauthorized access to your systems and you might also prevent a downtime event that more than pays for this software. Save a minute or more each time you access applications from a client over the life of your systems and now you have money in the bank.

Features

- ▶ Added Security to Thin Clients
- ▶ Boost Productivity
- ▶ Connect Instantly
- ▶ Short & Long Range
- ▶ RFID, USB Key Support
