

ThinManager Mirrored Licensing

Now you can get the advantages of ThinManager License Redundancy without having to install a second set of licenses! ThinManager Mirrored Licenses provide the ability to configure a mirrored ThinManager Server at a significant cost savings.

Add any of the Mirrored Licenses to your primary ThinManager Server and identify a second ThinManager Server to be used as a mirror. ThinManager will create a mirrored copy of the base license and configure this second server to be a mirrored ThinManager Server.

The mirrored ThinManager Server does not allow a ThinManager GUI connection but it does bring the peace of mind that comes from knowing that the Thin Client system will be fully functional even if the primary ThinManager Server becomes unavailable.

The mirrored ThinManager Server provides ample time to get the primary back up and running without the fear of lost operations.

The following products also have redundant license versions:

Failover

Failover Mirrored License

Share Keyboard and Mouse

Share Keyboard and Mouse Mirrored License

MultiSession

MultiSession Mirrored License

SmartSession

SmartSession Mirrored License

WinTMC

WinTMC Mirrored License

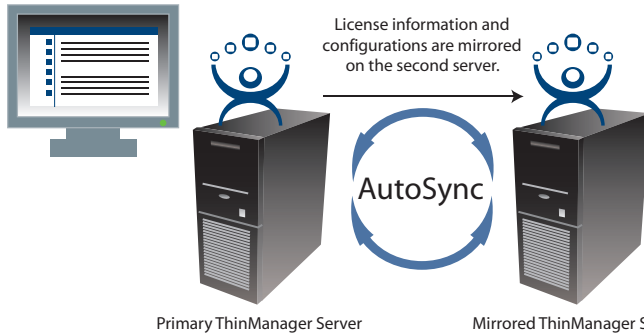

TermSecure

TermSecure Mirrored License

MultiMonitor

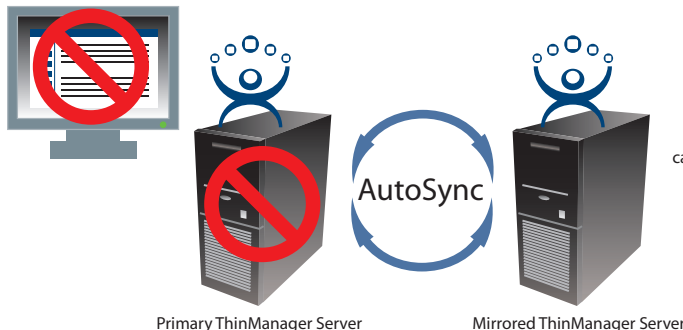

MultiMonitor Mirrored License

Manage clients and run ThinManager from the main server.

Thin Clients can boot and receive their configuration from the backup. You cannot manage clients from this server.

If the main server fails, the clients will get their configuration from the mirrored server.

Even though clients receive configuration and license information from the mirrored server you cannot use the ThinManager GUI until the primary server is restored. The GUI is always available when a full, standard ThinManager license is purchased.
